	ERCC8 Mouse Monoclonal Antibody [Clone ID: OTI1G2] – CF808577
Background:	This gene encodes a WD repeat protein, which interacts with Cockayne syndrome type B (CSB) protein and with p44 protein, a subunit of the RNA polymerase II transcription factor IIH. Mutations in this gene have been identified in patients with hereditary disease Cockayne syndrome (CS). CS cells are abnormally sensitive to ultraviolet radiation and are defective in the repair of transcriptionally active genes. Several transcript variants encoding different isoforms have been found for this gene. [provided by RefSeq, Mar 2014]
Synonyms:	CKN1; CSA; UVSS2
Protein Families	: Druggable Genome, Transcription Factors
Protein Pathwa	ys: Nucleotide excision repair, Ubiquitin mediated proteolysis

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY ERCC8 ([RC203124], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-ERCC8 (1:500). Positive lysates [LY423459] (100ug) and [LC423459] (20ug) can be purchased separately from OriGene.
