Gene Summary:The protein encoded by this gene is a member of the cyclin family of proteins. The encoded
protein interacts with cyclin-dependent kinase 8 and induces the phophorylation of the
carboxy-terminal domain of the large subunit of RNA polymerase II. The level of mRNAs for
this gene peaks in the G1 phase of the cell cycle. Two transcript variants encoding different
isoforms have been found for this gene. [provided by RefSeq, Jul 2008]
