| MW:           | 7.7 kDa  |
| Gene Summary: | The protein encoded by this gene can heterodimerize with mismatch repair endonuclease<br>PMS2 to form MutL alpha, part of the DNA mismatch repair system. When MutL alpha is<br>bound by MutS beta and some accessory proteins, the PMS2 subunit of MutL alpha<br>introduces a single-strand break near DNA mismatches, providing an entry point for<br>exonuclease degradation. The encoded protein is also involved in DNA damage signaling and<br>can heterodimerize with DNA mismatch repair protein MLH3 to form MutL gamma, which is<br>involved in meiosis. This gene was identified as a locus frequently mutated in hereditary<br>nonpolyposis colon cancer (HNPCC). [provided by RefSeq, Aug 2017] |
