Background:

This gene encodes beta-tropomyosin; a member of the actin filament binding protein family; and mainly expressed in slow; type 1 muscle fibers. Mutations in this gene can alter the expression of other sarcomeric tropomyosin proteins; and cause cap disease; nemaline myopathy and distal arthrogyriposis syndromes. Alternatively spliced transcript variants encoding different isoforms have been found for this gene. TPM2 has been shown to interact with RRAD; PDLIM7 and TPM1.

Synonyms:

AMCD1; DA1; DA2B; HEL-S-273; NEM4; TMSB

Cardiac muscle contraction, Dilated cardiomyopathy, Hypertrophic cardiomyopathy (HCM)
