Background:	Atrial Natriuretic Factor (ANF) is a 28 amino acid peptide hormone secreted mainly by the heart atria in response to atrial stretch. ANF acts on the kidney to increase sodium excretion and glomerular filtration rate (GFR), to antagonize renal vasoconstriction, and to inhibit renin secretion. In addition, Atrial Natriuretic Factor consists of Atrial Natriuretic Peptide (ANP) which exists in its precursor form, pro- ANP and it is an active ANP with a longer peptide chain (Urodilatin) and an antiparallel dimer of active ANP: This antibody was generated by immunization of rabbits with β -Atrial Natriuretic Factor (1-28) (Dimer, Antiparallel) coupled to a carrier protein.
