Background: This gene encodes a member of the NOD (nucleotide-binding oligomerization domain)

family. This member is a cytosolic protein. It contains an N-terminal caspase recruitment domain (CARD), a centrally located nucleotide-binding domain (NBD), and 10 tandem leucine-

rich repeats (LRRs) in its C terminus. The CARD is involved in apoptotic signaling, LRRs participate in protein-protein interactions, and mutations in the NBD may affect the process

of oligomerization and subsequent function of the LRR domain. This protein is an

intracellular pattern-recognition receptor (PRR) that initiates inflammation in response to a

subset of bacteria through the detection of bacterial diaminopimelic acid.

Synonyms: CARD4; CLR7.1; NLRC1
