#### **GRIGENE** RASA1 Rabbit Polyclonal Antibody – TA380722

Background:The protein encoded by this gene is located in the cytoplasm and is part of the GAP1 family of<br/>GTPase-activating proteins. The gene product stimulates the GTPase activity of normal RAS<br/>p21 but not its oncogenic counterpart. Acting as a suppressor of RAS function, the protein<br/>enhances the weak intrinsic GTPase activity of RAS proteins resulting in the inactive GDP-<br/>bound form of RAS, thereby allowing control of cellular proliferation and differentiation.<br/>Mutations leading to changes in the binding sites of either protein are associated with basal<br/>cell carcinomas. Mutations also have been associated with hereditary capillary malformations<br/>(CM) with or without arteriovenous malformations (AVM) and Parkes Weber syndrome.<br/>Alternative splicing results in two isoforms where the shorter isoform, lacking the N-terminal<br/>hydrophobic region but retaining the same activity, appears to be abundantly expressed in<br/>placental but not adult tissues.

Synonyms:
