	JNK1 (MAPK8) Mouse Monoclonal Antibody [Clone ID: OTI2F10] – TA500275S	
Background:	JNK1 is a member of the MAP kinase family. MAP kinases act as an integration point for multiple biochemical signals, and are involved in a wide variety of cellular processes such as proliferation, differentiation, transcription regulation and development. JNK1 is activated by various cell stimuli, and targets specific transcription factors, and thus mediates immediate- early gene expression in response to cell stimuli. The activation of JNK1 by tumor-necrosis factor alpha (TNF-alpha) is found to be required for TNF-alpha induced apoptosis. JNK1 is also involved in UV radiation induced apoptosis, which is thought to be related to cytochrom c- mediated cell death pathway. Studies of the mouse counterpart of JNK1 gene suggested that it play a key role in T cell proliferation, apoptosis and differentiation. Four alternatively spliced transcript variants encoding distinct isoforms have been reported

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY MAPK8 ([RC218407], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-MAPK8. Positive lysates [LY400970] (100ug) and [LC400970] (20ug) can be purchased separately from OriGene.
