CRIGENE Amyloid Precursor Protein (APP) Mouse Monoclonal Antibody [Clone ID: OTI7G9] – TA500969

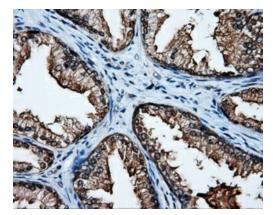

- Background: This gene encodes a cell surface receptor and transmembrane precursor protein that is cleaved by secretases to form a number of peptides. Some of these peptides are secreted and can bind to the acetyltransferase complex APBB1/TIP60 to promote transcriptional activation, while others form the protein basis of the amyloid plaques found in the brains of patients with Alzheimer disease. Mutations in this gene have been implicated in autosomal dominant Alzheimer disease and cerebroarterial amyloidosis (cerebral amyloid angiopathy). Multiple transcript variants encoding several different isoforms have been found for this gene.
- Synonyms:AAA; ABETA; ABPP; AD1; APPI; CTFgamma; CVAP; PN-II; PN2Protein Families:Druggable Genome, Transmembrane

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY APP ([RC221339], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-APP (TA500969). Positive lysates [LY424694] (100ug) and [LC424694] (20ug) can be purchased separately from OriGene.

Immunofluorescent staining of HepG2 cells using anti-APP mouse monoclonal antibody (TA500969).

HEK293T cells transfected with either pCMV6-ENTRY APP ([RC221339]) (Red) or empty vector control plasmid (Blue) were immunostained with anti-APP mouse monoclonal (TA500969), and then analyzed by flow cytometry.
