Background: LPL encodes lipoprotein lipase, which is expressed in heart, muscle, and adipose tissue. LPL

functions as a homodimer, and has the dual functions of triglyceride hydrolase and

ligand/bridging factor for receptor-mediated lipoprotein uptake. Severe mutations that cause LPL deficiency result in type I hyperlipoproteinemia, while less extreme mutations in LPL are

linked to many disorders of lipoprotein metabolism. [provided by RefSeq]

HEK293T cells were transfected with the pCMV6-ENTRY control (Cat# [PS100001], Left lane) or pCMV6-ENTRY LPL (Cat# [RC203766], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-LPL (Cat# [TA503793]). Positive lysates [LY400089] (100ug) and [LC400089] (20ug) can be purchased separately from OriGene.

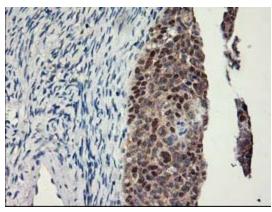

Western blot analysis of extracts (10ug) from 2 different cell lines by using anti-LPL monoclonal antibody (1:200).

Immunohistochemical staining of paraffinembedded Adenocarcinoma of Human ovary tissue using anti-LPL mouse monoclonal antibody. (Heat-induced epitope retrieval by 10mM citric buffer, pH6.0, 100°C for 10min, [TA503793])

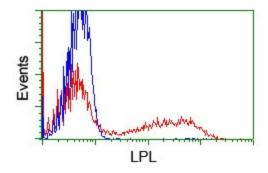

Immunohistochemical staining of paraffinembedded Human endometrium tissue within the normal limits using anti-LPL mouse monoclonal antibody. (Heat-induced epitope retrieval by 10mM citric buffer, pH6.0, 100°C for 10min, [TA503793])

HEK293T cells transfected with either [RC203766] overexpress plasmid (Red) or empty vector control plasmid (Blue) were immunostained by anti-LPL antibody ([TA503793]), and then analyzed by flow cytometry.
