| Background:             | This gene is the putative transforming gene of avian sarcoma virus 17. It encodes a protein<br>which is highly similar to the viral protein, and which interacts directly with specific target<br>DNA sequences to regulate gene expression. This gene is intronless and is mapped to 1p32-<br>p31, a chromosomal region involved in both translocations and deletions in human<br>malignancies. [provided by RefSeq, Jul 2008] |
| Synonyms:               | AP-1; AP1; c-Jun  |

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY JUN ([RC209804], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-JUN. Positive lysates [LY400825] (100ug) and [LC400825] (20ug) can be purchased separately from OriGene.

Western blot analysis of extracts (35ug) from 9 different cell lines by usin g anti-JUN monoclonal antibody (HepG2: human; HeLa: human; SVT2: mouse; A549: human; COS7: monkey; Jurkat: human; MDCK: canine; PC12: rat; MCF7: human).
