Background:	CD2 is a surface antigen of the human T-lymphocyte lineage that is expressed on all peripheral blood T cells (summarized by Sewell et al., 1986 [PubMed 3490670]). It is one of the earliest T-cell markers, being present on more than 95% of thymocytes; it is also found on some natural killer cells but not on B lymphocytes. Monoclonal antibodies directed against CD2 inhibit the formation of rosettes with sheep erythrocytes, indicating that CD2 is the erythrocyte receptor or is closely associated with it. HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY CD2 ([RC206612], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-CD2. Positive lysates [LY400671] (100ug) and [LC400671] (20ug) can be purchased separately from OriGene.

Flow cytometric analysis of living 293T cells transfected with CD2 overexpression plasmid ([RC206612], Red)/empty vector ([PS100001], Blue) using anti-CD2 antibody ([TA800674]). Cells incubated with a non-specific antibody (Green) were used as isotype control (1:100).
