#### S100 beta (S100B) Mouse Monoclonal Antibody [Clone ID: OTI3G6] – TA807235

Background:The protein encoded by this gene is a member of the S100 family of proteins containing 2 EF-<br/>hand calcium-binding motifs. S100 proteins are localized in the cytoplasm and/or nucleus of a<br/>wide range of cells, and involved in the regulation of a number of cellular processes such as<br/>cell cycle progression and differentiation. S100 genes include at least 13 members which are<br/>located as a cluster on chromosome 1q21; however, this gene is located at 21q22.3. This<br/>protein may function in Neurite extension, proliferation of melanoma cells, stimulation of<br/>Ca2+ fluxes, inhibition of PKC-mediated phosphorylation, astrocytosis and axonal<br/>proliferation, and inhibition of microtubule assembly. Chromosomal rearrangements and<br/>altered expression of this gene have been implicated in several neurological, neoplastic, and<br/>other types of diseases, including Alzheimer's disease, Down's syndrome, epilepsy,<br/>amyotrophic lateral sclerosis, melanoma, and type I diabetes. HEK293T cells were transfected with the pCMV6-ENTRY control (Cat# [PS100001], Left lane) or pCMV6-ENTRY S100B (Cat# [RC200277], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-S100B. (1:2000) (1:500) (Cat# TA807235). Positive lysates [LY416735] (100ug) and [LC416735] (20ug) can be purchased separately from OriGene.

Immunohistochemical staining of paraffinembedded Human embryonic cerebellum within the normal limits using anti-S100B mouse monoclonal antibody. (Heat-induced epitope retrieval by 1mM EDTA in 10mM Tris buffer (pH8.5) at 120°C for 3min, TA807235) (1:5000)
