Background: This gene encodes a phosphoprotein that binds to the Na+/H+ exchanger NHE1. This protein

serves as an essential cofactor which supports the physiological activity of NHE family members and may play a role in the mitogenic regulation of NHE1. The protein shares similarity with calcineurin B and calmodulin and it is also known to be an endogenous

inhibitor of calcineurin activity. [provided by RefSeq, Jul 2008]

HEK293T cells were transfected with the pCMV6-ENTRY control (Left lane) or pCMV6-ENTRY CHP1 ([RC201928], Right lane) cDNA for 48 hrs and lysed. Equivalent amounts of cell lysates (5 ug per lane) were separated by SDS-PAGE and immunoblotted with anti-CHP1 (1:2000) ([TA810172]). Positive lysates [LY402116] (100ug) and [LC402116] (20ug) can be purchased separately from OriGene.

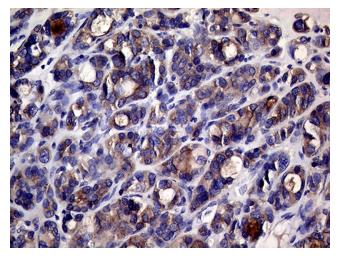

Western blot analysis of extracts (35ug) from 4 different cell lines by using anti-CHP1 monoclonal antibody (1:500).
